

iBo

Helping pets stay well while reducing owner anxiety

Problem

Pet wellness is no longer only about animal health — it is becoming a **mental wellness issue for owners too**. Many pet owners check cameras repeatedly during the workday, yet still feel anxious, because seeing a pet “just lying there” tells them nothing about whether it is actually okay.

Current solutions — pet cameras, smart collars, and activity trackers — still place the burden of interpretation entirely on the owner. Owners do not need more data. They need **meaningful reassurance**.

Our Solution

iBo is a smart pet wellness system that learns each pet’s individual normal routine and tells owners when something is off — before visible symptoms appear. Inspired by how Netflix builds a personal profile over time, iBo becomes more accurate the longer it runs.

The system works entirely with existing hardware (a camera and temperature/humidity sensor), requiring no new devices or wearables.

Key Features

Pet Report Card — every evening, owners receive a short daily summary: activity level, eating and drinking patterns, rest behavior, and home temperature. No need to open the camera app. Just check the report.

Sick Day Detector — the AI detects subtle behavioral shifts (e.g. water intake dropping 40% over two days) and alerts owners 2–3 days before symptoms become visible, shifting care from reactive to preventive.

Safe Zone Alert — in Thailand’s climate, air conditioners fail and indoor temperatures can spike quickly. iBo alerts owners the moment conditions become dangerous for their pet.

Target Users

Our primary users are working professionals who leave their pets alone at home during the day and experience anxiety or guilt while doing so. This includes owners of elderly or chronically ill pets who require closer monitoring, and multi-pet households where tracking each animal’s individual behavior is difficult to do manually.

Business Model

Revenue flows from hardware sales (camera + sensor kit) and monthly or annual subscriptions for premium AI features, including the *Vet-Ready Report* — a 30-day behavioral record owners can share directly with their veterinarian.

Future Opportunities

Once the core product is established, iBo can expand into B2B markets including pet daycare centers and veterinary clinics, integrate with pet insurance companies for anonymized risk profiling, and offer personalized long-term health recommendations as data accumulates over time.

“You do not need to watch your pet all the time. You just need to know they are okay.”
